My First Report

Cole Young

Welcome to your practice report

This is a **Quarto** document. It mixes ordinary writing with live code, so your report and your analysis always stay in sync. When you click **Render**, Quarto runs the code below and builds a finished HTML page.

Try it now: change `author: "Your Name"` in the header above to your own name, then click **Render**.

A first look at the data

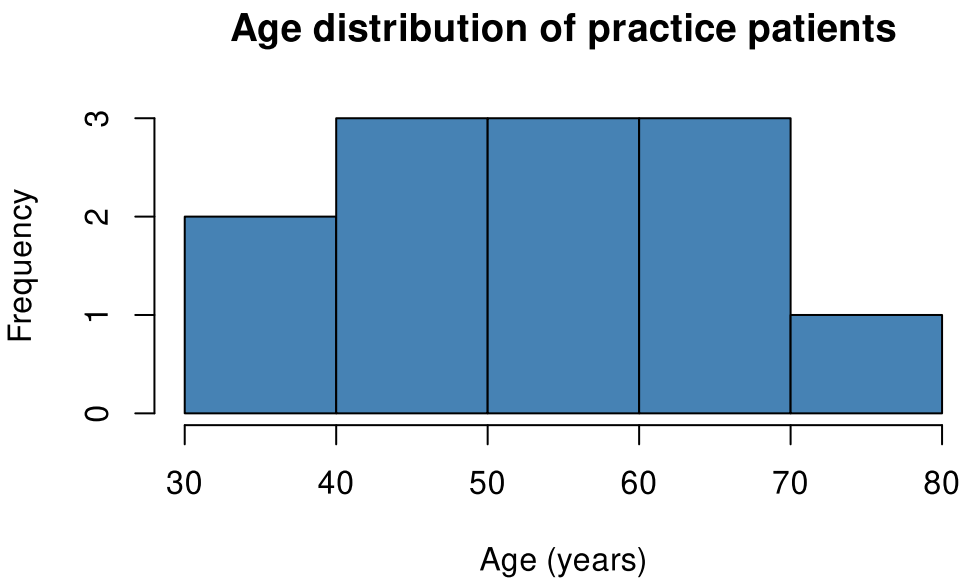

The code chunk below reads a small practice dataset from the `data/` folder and shows the first few rows.

```
patients <- read.csv("data/patients.csv")
head(patients)
```

```
  id age sex region systolic_bp diabetes
1  1  54   F  North         128       no
2  2  61   M  North         141      yes
3  3  47   F  South         119       no
4  4  72   M   East         150      yes
5  5  38   F   West         112       no
6  6  59   M  South         134       no
```

A first chart

```
hist(patients$age,
     main = "Age distribution of practice patients",
     xlab = "Age (years)",
     col  = "steelblue")
```

Your turn

- In this chart I noticed that the standard deviation is very low and that it is a normal dataset.
- Render again and check that both your sentence and the chart appear.

When you are happy with the result, **commit and sync** your work (the Week 2 course page walks you through this), then submit your repository link on Canvas.

Assignment 1 Portion

My Bolded Notes

- This class I learned how to edit, save, and upload work using codespaces. Previously, I was confused as to how to run the code given I mostly worked in the terminal but now with qmd files, rendering at html, and then committing to github, it is starting to make more sense.

```
c(78, 85, 64, 54, 102, 98.6)
```

```
[1]  78.0  85.0  64.0  54.0 102.0  98.6
```

```
temperatureF <- c(78, 85, 64, 54, 102, 98.6)
temperatureC <- (temperatureF - 32) * 5/9
temperatureC[2]
```

```
[1] 29.44444
```
